

An OSI Systems Company

Rapiscan Systems is a leading supplier of screening solutions that help governments, corporations, law enforcement and military organizations around the world combat terrorism, drug and weapons smuggling, illegal immigration and trade fraud with speed and confidence while maximizing operational efficiency and meeting the most stringent security regulations and standards. Our worldwide Security service network is committed to providing “best-in-class” support across the globe, ensuring that systems are maintained and serviced in the most timely and effective manner possible.

With our extensive industry knowledge and broad product portfolio, we specialize in solving complex security needs. We focus on providing products, services and solutions that meet demanding security requirements while simultaneously offering customers outstanding value for their security screening operations. Our products and services, along with those from our sister organization American Science and Engineering (AS&E®), utilize multiple inspection technologies and advanced threat identification algorithms for baggage and parcel inspection, cargo and vehicle inspection, hold baggage and people screening, radiation detection, and explosive and narcotics trace detection.

Our high-energy and dual-energy transmission technology penetrates dense cargo and parcels to generate colorized X-ray images that discriminate between organic and metallic materials to help uncover trade fraud and smuggling. AS&E’s signature Z Backscatter® or low-energy X-ray inspection technology can be used alone or with dual-energy transmission X-rays to enhance operators’ detection of organic materials. Our combination of inspection systems, technologies and services provide our customers with a complete range of offerings to meet evolving security and operational requirements.
